EXECUTIVE SUMMARY

- 1) Actuarial Partners was appointed by LIAM to construct a new Mortality Table for the period of 2011 to 2015. All life insurance companies operating in Malaysia have been requested to submit the number of in-force policies as at the end of each calendar year as well as the number of deaths during each calendar year from 2010 to 2015.
- 2) Data was first split to male and female, and then to medical, non-medical and non-underwritten lives. Medical refers to life medically examined on entry. Non-medical refers to life not medically examined on entry but satisfactory evidence of health has been received. Non-underwritten refers to policies sold without underwriting.
- 3) A summary of all data considered in this study is shown in the following table:

Table 1.1: Summary of the Data

| Class of Business | Males | | Females | |
|--|------------------------|---------------|------------------------|---------------|
| | Exposed to Risk | Deaths | Exposed to Risk | Deaths |
| Ordinary and Unit Linked Business | | | | |
| With Medical | 1,730,178 | 6,205 | 1,332,027 | 2,885 |
| Without Medical | 14,055,077 | 26,830 | 13,322,541 | 14,372 |
| Without Underwriting | 226,339 | 506 | 272,645 | 343 |
| Total | 16,011,594 | 33,541 | 14,927,213 | 17,600 |

- 4) The aggregate numbers of exposed to risk for non-medical lives provide satisfactory bases for the study. Therefore, the construction of the mortality table was based on the non-medical mortality experience. The study is carried out based on lives with Death coverage without Dread Disease.
- 5) The exposure is calculated using a census method. The age definition used is age next birthday at 31 December for in-force and age next birthday at death for deaths. Duration is defined as curtate. The formula used to calculate the initial exposed to risk is as below;

For a particular calendar year Y:

$$Ex,r = (StartIf x,r + EndIf x,r + Death x,r)/2$$

Where:

Ex,r = Initial exposure at age x and duration r

StartIf x,r = In force at 1/Jan/Y at age x and duration r

EndIf x,r = In force at 1/Jan/Y+1 at age x and duration r

Death x,r = Actual death during Y at age x and duration r

Note: StartIf x,r and EndIf x,r comprise entirely different sets of lives.

- 6) Table below shows the mortality experience and average age of non-medical male lives with Ordinary and Unit Linked policies and subdivided by duration.

Table 1.2: Summary of the Male Mortality Experience by Duration

| Duration Of Policy | Exposed to Risk | Average Age | Deaths | | Ratio of Actual to Expected² |
|------------------------------------|----------------------------|------------------------|---------------|-----------------------------|--|
| | | | Actual | Expected¹ | |
| (Years) | (1) | (2) | (3) | (4) | (5) |
| Without Medical Examination | | | | | |
| 0 | 1,489,120 | 26.6 | 1,249 | 2,149 | 0.58 |
| 1 | 1,267,034 | 27.2 | 1,123 | 1,883 | 0.59 |
| 2 | 1,070,039 | 27.9 | 1,165 | 1,688 | 0.68 |
| 3 | 922,227 | 28.5 | 1,008 | 1,535 | 0.65 |
| 4+ | 9,306,658 | 36.2 | 22,083 | 32,268 | 0.68 |
| Total | 14,055,077 | 33.2 | 26,628 | 39,524 | 0.67 |

1 The Expected number of deaths has been calculated by reference to the M1999-2003 (MO) table

2 Non-medical deaths at age less than 5 are excluded as there is no mortality rate for the corresponding ages in M1999-2003 (MO) table.

- 7) Table 1.3 shows the non-medical mortality rates for the period under review, the non-medical mortality rates for the 2006/2010 mortality study and the corresponding M9903 (MO) rates. The rates produced for M9903 (MO) were based on non-medical lives only therefore the comparison made was against the non-medical experience.

Table 1.3: Comparison of Non-Medical Mortality Rates against 2006/10 Rates and M9903 (MO)

| Age Group | Rates of Mortality | | | Ratios | |
|----------------------|---------------------------|---------------------------|-------------------------|-------------------|-------------------|
| | Male* 2011/15 | Male** 2006/10 | M9903** (MO) | (1) Vs (2) | (1) Vs (3) |
| | (1) | (2) | (3) | (4) | (5) |
| 01 - 05 | 0.00019 | 0.00025 | N/A | (25%) | N/A |

| 81 - 85 | 0.07875 | 0.06939 | 0.09797 | 13% | (20%) |
| 86 - 90 | 0.08274 | N/A | 0.14384 | N/A | (42%) |
| 91 - 95 | 0.04630 | N/A | 0.21209 | N/A | (78%) |
| 96 - 100 | 0.01274 | N/A | 0.29938 | N/A | (96%) |

* Non-medical Male Ordinary and Unit Linked Lives

** Non-medical Male Ordinary Lives

The ratios in column (4) and (5) of Table 1.3 show that the mortality experience of non-medical male lives during 2011 to 2015 is relatively lower than the non-medical male mortality experience of the previous 2006/2010 study and the rates from M9903 (MO).

- 8) The mortality experience for female lives with Ordinary and Unit Linked policies subdivided by duration is shown in the following table.

Table 1.4: Summary of the Female Mortality Experience by Duration

| Duration Of Policy | Exposed to Risk (1) | Average Age (2) | Deaths | | Ratio of Actual to Expected² (5) |
|------------------------------------|------------------------------------|--------------------------------|-----------------------|-------------------------------------|--|
| | | | Actual (3) | Expected¹ (4) | |
| Without Medical Examination | | | | | |
| 0 | 1,450,523 | 27.9 | 365 | 1,117 | 0.32 |
| 1 | 1,275,027 | 28.6 | 448 | 1,035 | 0.42 |
| 2 | 1,100,533 | 29.6 | 646 | 972 | 0.66 |
| 3 | 955,137 | 30.2 | 596 | 904 | 0.64 |
| 4+ | 8,541,322 | 36.2 | 12,195 | 14,850 | 0.82 |
| Total | 13,322,541 | 33.6 | 14,250 | 18,878 | 0.75 |

1 The expected number of deaths has been calculated by reference to the M1999-2003 (FO) table

2. Non-medical deaths at age less than 5 are excluded as there is no mortality rate for the corresponding ages in M1999-2003 (FO) table.

- 9) Table 1.5 shows the non-medical mortality rates for the period under review and the corresponding M9903 (FO) rates. The rates produced for M9903 (FO) were based on non-medical lives only therefore the comparison made was against the non-medical experience. A graph of these mortality rates is presented on the next page.

Table 1.5: Comparison of Non-Medical Mortality Rates against 2006/10 Rates and M9903 (FO)

| Age Group | Rates of Mortality | | | Ratios | |
|-----------|---------------------------|----------------------------|------------------------|-------------------|-------------------|
| | Female* 2011/15 (1) | Female** 2006/10 (2) | M9903** (FO) (3) | (1) Vs (2) (4) | (1) Vs (3) (5) |
| | | | | | |
| 01 - 05 | 0.00020 | 0.00021 | N/A | (6%) | N/A |
| 06 - 10 | 0.00010 | 0.00017 | 0.00017 | (43%) | (43%) |

* Non-medical Female Ordinary and Unit Linked Lives

** Non-medical Female Ordinary Lives

The ratios in column (5) of Table 1.5 show the mortality rates of non-medical female lives during 2011 to 2015 are significantly lower than the rates from M9903 (FO) except for ages 71 to 90.

- 10) The construction of the mortality table was based on the non-medical mortality experience for lives assured with curtate duration greater or equal to 2 years for Ordinary Whole Life, Endowment and Unit Linked Insurance policies during the five years ending 31 December 2015. Crude rates are derived based on the number of deaths and exposure in each age and a few graduation methods are considered based on the distribution of the crude rates.

- 11) For Male, 4 graduation methods are used in order to come out with the graduated rates namely Whittaker-Henderson, Heligman-Pollard, Cubic Spline and Coale Kisker method as follows:
 - Age 5 – 16: Whittaker method is used to smoothen up the volatile crude rates in early ages. These ages are not credible and thus more weight is placed on smoothness over goodness of fit.
 - Age 17 - 23: Heligman-Pollard is then used as it can provide a smoother and a better fit curve for the accident hump.
 - Age 24 – 71: Cubic Spline method is used with the knot being placed at age 24, 52, 67 and 76. Cubic Spline is known for its ability to fit the curve nicely throughout credible ages.
 - Age 72 – 99: Coale Kisker method is used instead of common exponential method as it can produce a smoother closure of a life table. The start age for Coale Kisker method is set at age 73 with the target age of 115.
- 12) For Female, 3 graduation methods are used to produce the graduated rates which are Heligman-Pollard, Cubic Spline and Coale Kisker as follows:
 - Age 5 – 29: Heligman-Pollard is used for these ages as it produced a smooth curve which fit quite nicely to the pattern of the crude rates. There is no accident hump observed for Females and thus only 1 method is used to graduate the crude rates from age 5-29.
 - Age 30 – 75: Cubic Spline is used throughout credible ages (age 30-75) with knot being placed at age 24, 47, 62 and 75.
 - Age 76 – 99: Coale Kisker is also used for Female for a similar reason with start age of 68 and target age of 120.
- 13) A few tests have been conducted to assess the smoothness, goodness of fit and reasonableness of the graduated rates against the crude rates.
 - For smoothness test, both Male and Female satisfy the first condition of Barnett's Rule of Thumb 86.2% of the time and 84.0% respectively.
 - The goodness of fit of the graduated rates is assessed by comparing actual versus expected. Both Male and Female are 100.1% and 101.2% respectively close to the actual.
 - Sign test is conducted to see the reasonableness of the graduated rates by testing the difference between crude rates and graduated rates. For Male, 57.7% positive sign and 42.3% negative sign whereas for Female, 54.6% positive sign and 45.4% negative sign. Both are indicating the graduated rates are appropriate.
 - A runs test was also conducted to see if the function fits well to the data set. The test concluded that Male and Female graduated curve fit well to the data set with 95% confidence.
 - We have also calculated confidence interval along the crude rates by using Garwood's method to see whether the graduated rates are within a 95% confidence interval. Both Male and Female graduated rates are 92.8% within the confidence interval.

14) The graduated mortality rates with age next birthday definition are as below.

| GRADUATED RATES | | | | | | | | |
|-----------------|---------|---------|-------------|---------|---------|-------------|---------|---------|
| AGE NEXT | MALE | FEMALE | AGE NEXT | MALE | FEMALE | AGE NEXT | MALE | FEMALE |
| 1 | 0.00014 | 0.00013 | 34 | 0.00094 | 0.00043 | 67 | 0.01407 | 0.00958 |
| 2 | 0.00014 | 0.00013 | 35 | 0.00098 | 0.00046 | 68 | 0.01554 | 0.01110 |
| 3 | 0.00014 | 0.00013 | 36 | 0.00103 | 0.00050 | 69 | 0.01723 | 0.01289 |
